Course Summary & Feedback

Congratulations on the successful completion of the course!

In our life, we generally push ourselves to acquire more knowledge and complete our tasks more efficiently. In a similar way, we need to tune our machine learning model so that its performance can become better.

> In Feature Engineering and Cross-validation, we have learned about different validation techniques such as K-fold and Leave one out (LOOCV), handling imbalanced datasets, and regularization techniques.
>
> In ML pipeline and hyperparameter tuning, we have learned how to build pipelines and tune model hyperparameters by using GridSearch and Randomizedsearch.

With the completion of the model tuning course, you now have the background to understand how you can improve the performance of your model by tuning the hyperparameters. On completing the hands-on exercises in the courses, you are now capable enough to build models to solve real-world business problems. The course has given you a good exposure to understand different parameters involved in an algorithm and how we can build a pipeline to get everything in one line code.

Appreciate yourself to come this far and understand the concepts which take time and effort to get a hold on.

Great Learning is always focused on the improvement of their learners' learning journey. As part of this process, we would like to know your opinion regarding this course via a short survey.

We would highly appreciate it if you could take a few minutes to provide your valuable suggestions in the content feedback form ahead.

Happy Learning!
